

ABSTRACT

In this example, the code uses HTML for input and a button to trigger the extraction process. JavaScript handles reading the file, analysing the content, and extracting the text below the specified title. Remember to replace "Abstract" with your target title. This is a basic example that works for simple scenarios. For more complex document structures and formats, you might need to use more advanced libraries and techniques, similar to the approach mentioned earlier in the C# example.

INTRODUCTION

In this example, the code uses HTML for input and a button to trigger the extraction process. JavaScript handles reading the file, analysing the content, and extracting the text below the specified title. Remember to replace "Abstract" with your target title. This is a basic example that works for simple scenarios. For more complex document structures and formats, you might need to use more advanced libraries and techniques, similar to the approach mentioned earlier in the C# example.
